

CIS 490 Teams: Rules, Norms, Expectations

CIS 490 is your capstone course in the CIS program.

Plan to work much more than you might on other courses in the program. Plan to give it your full attention throughout the semester.

Free riding will not be tolerated in this senior project class.

- Do not wait for someone to assign you a task – volunteer to do whatever you can do on the project.
- The successful completion of the project depends on the work of **every member throughout the entire project**.
- Problems often arise if team members work sequentially on the project. The people at the end may get overwhelmed unless the project is perfectly planned out.

Team roles:

All team members, including the team/scrum leader, project manager, etc. must also participate in working on the project as well. Otherwise, your team will not be able to finish the job.

Team/Scrum leader Marlene Delgado

- should be someone who can lead the team,
- enthusiastic about the project,
- first to arrive and last to leave at team meetings,
- controls the agenda and tempo of the team meetings,
- updates the attendance record after each meeting,
- team leader should also participate actively in work of the project.

Project Manager Luis Ibarra

- uses project management tool (Microsoft Project Manager) to plan project tasks,
- works with team to assign team members to complete tasks,
- complies team members' weekly time sheets,
- records task completion and actual hours worked on tasks,
- updates all the project management documentations after each meeting,
- prepares periodic reports on project progress,
- project manager should also actively work on the project and pull the documentation/files together and publishing them.

Documentation/Training Ryan Vargas, Angelina Viveros, Devin Arucan

- may be done by one team member or several team members,
- the persons taking these roles usually also work on the main project tasks but do participate in this as additional work.

How to be successful:

When to take CIS 490

- Take this senior project class near the end of your coursework because you have more to contribute.

How to form a solid team

- **Become part of a team where you can contribute your own expertise and strengths.**
- Spend time upfront forming team bonds and a team identity.
- Establish team norms of responsibility and contributions by EVERYONE on the team.
- Talk about team expectations and norms.
- Teams that become cohesive EARLY perform much better and finish their projects in a more timely manner.
- **Participate fully in teamwork** from the very beginning and treat others with respect.
- Working or taking many other classes is NOT an excuse for NOT contributing to your senior project.
- **Do NOT take concurrently with other group project classes because the course work in this class is time-consuming and labor-intensive.**
- Do not be a free rider. Teams may divorce free riders through due process (documentation and a warning). If your team divorces you, you will receive a grade of “F”.
- **Do not enable free riders.** Require every person on your team to work. Do NOT do ALL the project work when others fail to deliver. Peer pressure is a VERY STRONG motivator.
- **Speak up during project meetings.**
 - Wear nametags.
 - Be sure your customer knows WHO you are and WHAT you are contributing to the project.
 - Customers grade you at the end of the project.
